ABOUT TASK 3

Task 3 is called Data Fairness and Version Control, and it works on [task2_cleaned_data.csv](#) – the cleaned file from Task 2.

It has two very different halves. The first is a written comparison that asks you to judge whether the data represents the community fairly. The second is a saved history of how your project work was actually done, step by step, using the version control skills from Week 17.

ABOUT TASK 3

Start by comparing the neighbourhoods the program serves against each other. For every neighbourhood present in the data, you need two numbers: how many members it has, and how many checkouts belong to it.

The point of gathering both numbers isn't to describe each neighbourhood on its own – it's to place them side by side so they can be measured against one another. A number only becomes meaningful once you can see how it compares.

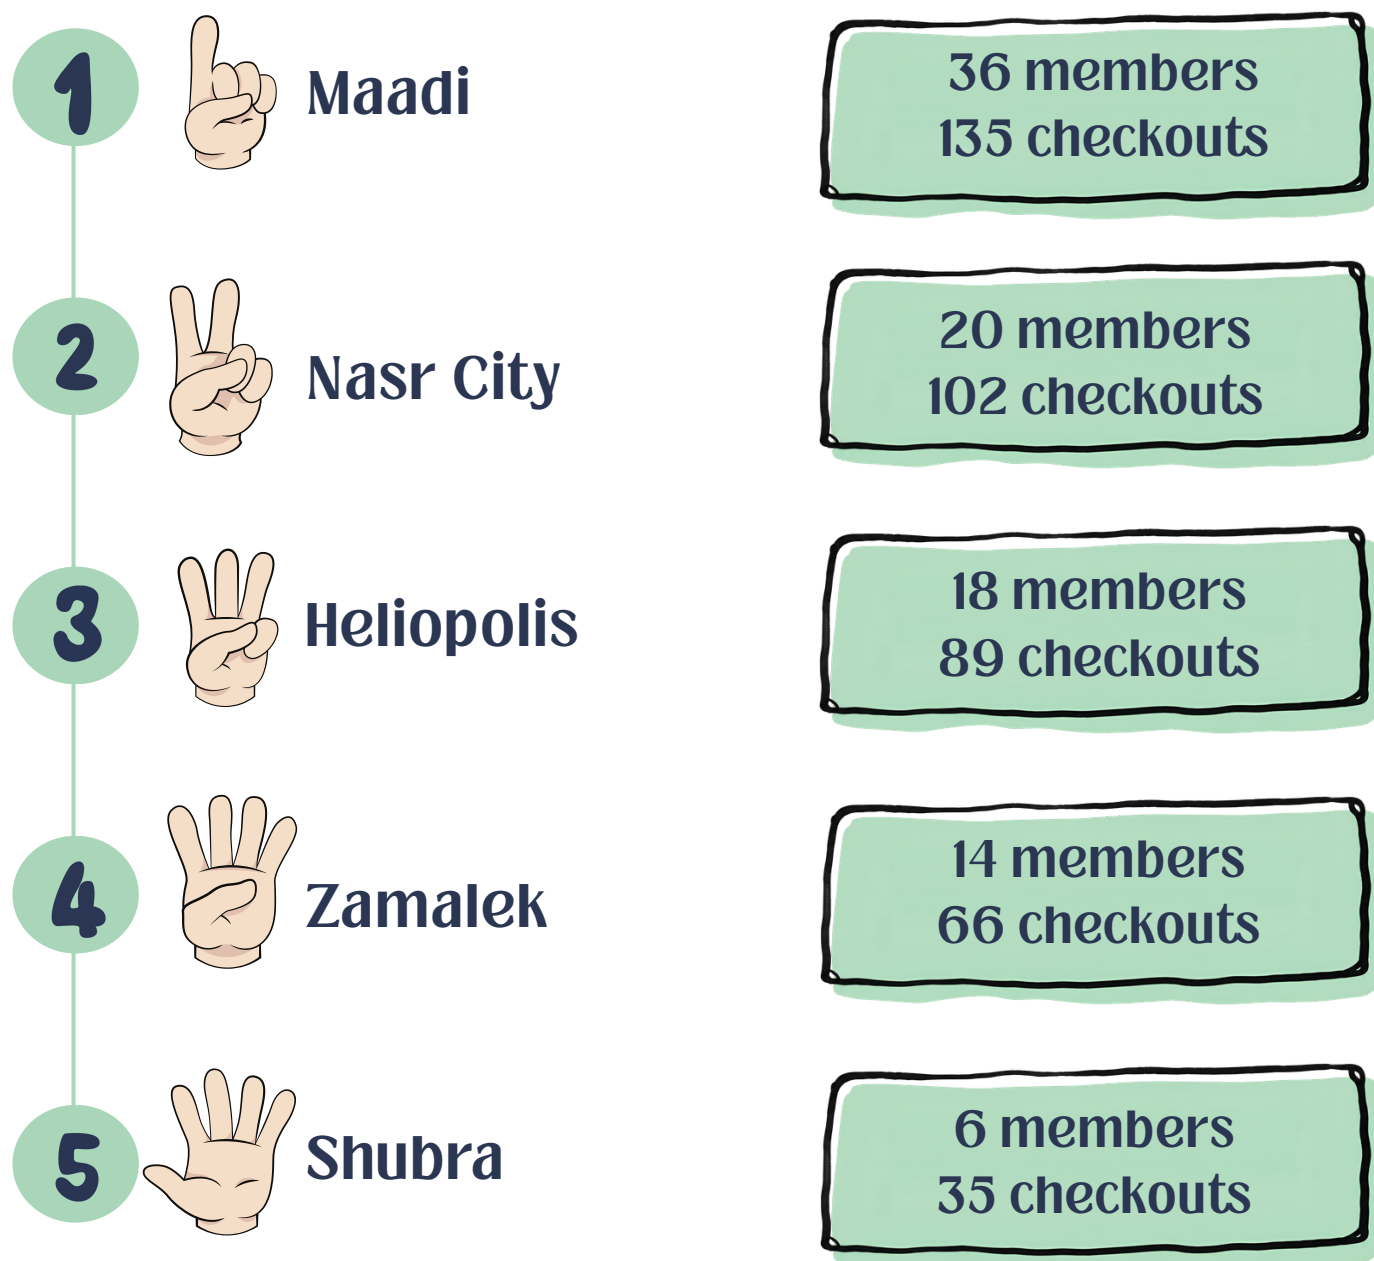

IS ANY NEIGHBOURHOOD UNDER-REPRESENTED

1. The basis on which under-representation is determined :

To identify cases of under-representation, I examined the data in the neighborhood_comparing_members_checkouts table, focusing on 2 numbers which are: the total_members and total_checkouts. A neighbourhood is regarded as under-represented in this case when both of these figures are much lower than in other areas.

2.Finding

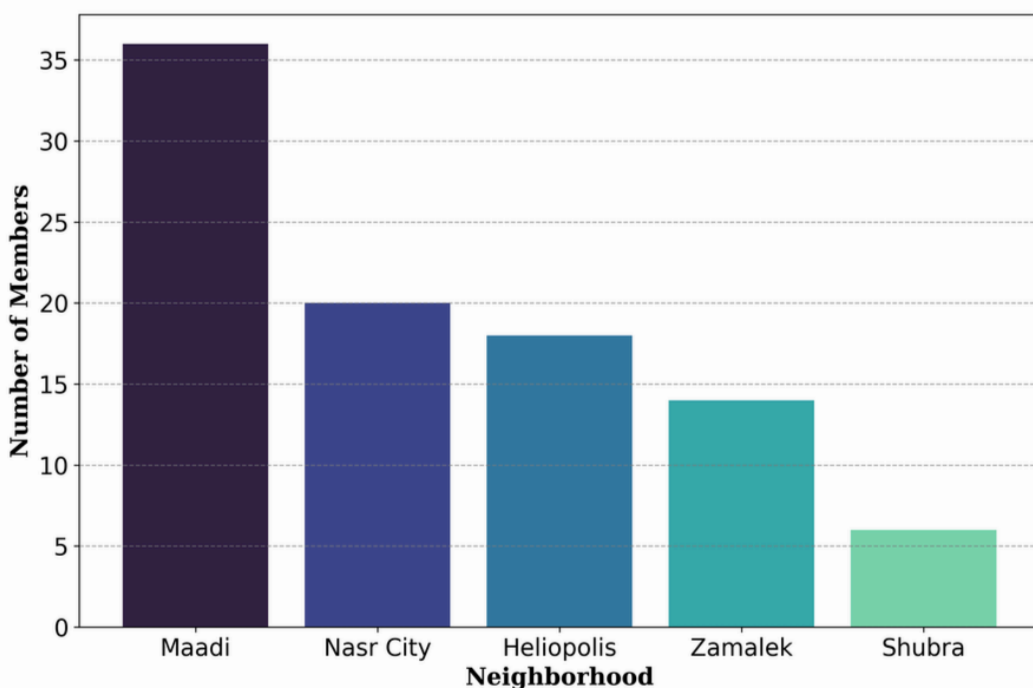

Based on this standard, Shubra is clearly the most under-represented neighbourhood.

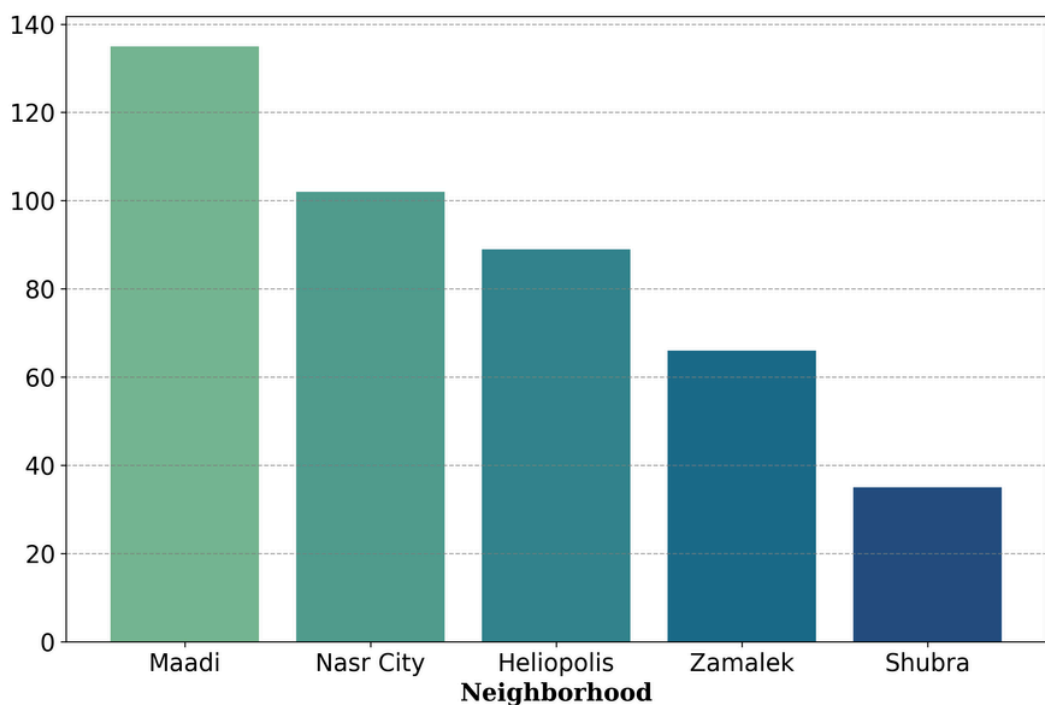

This suggests that the library currently has a very limited presence and low engagement in this specific area

THE COMPARISION

Total Members

Total Checkouts

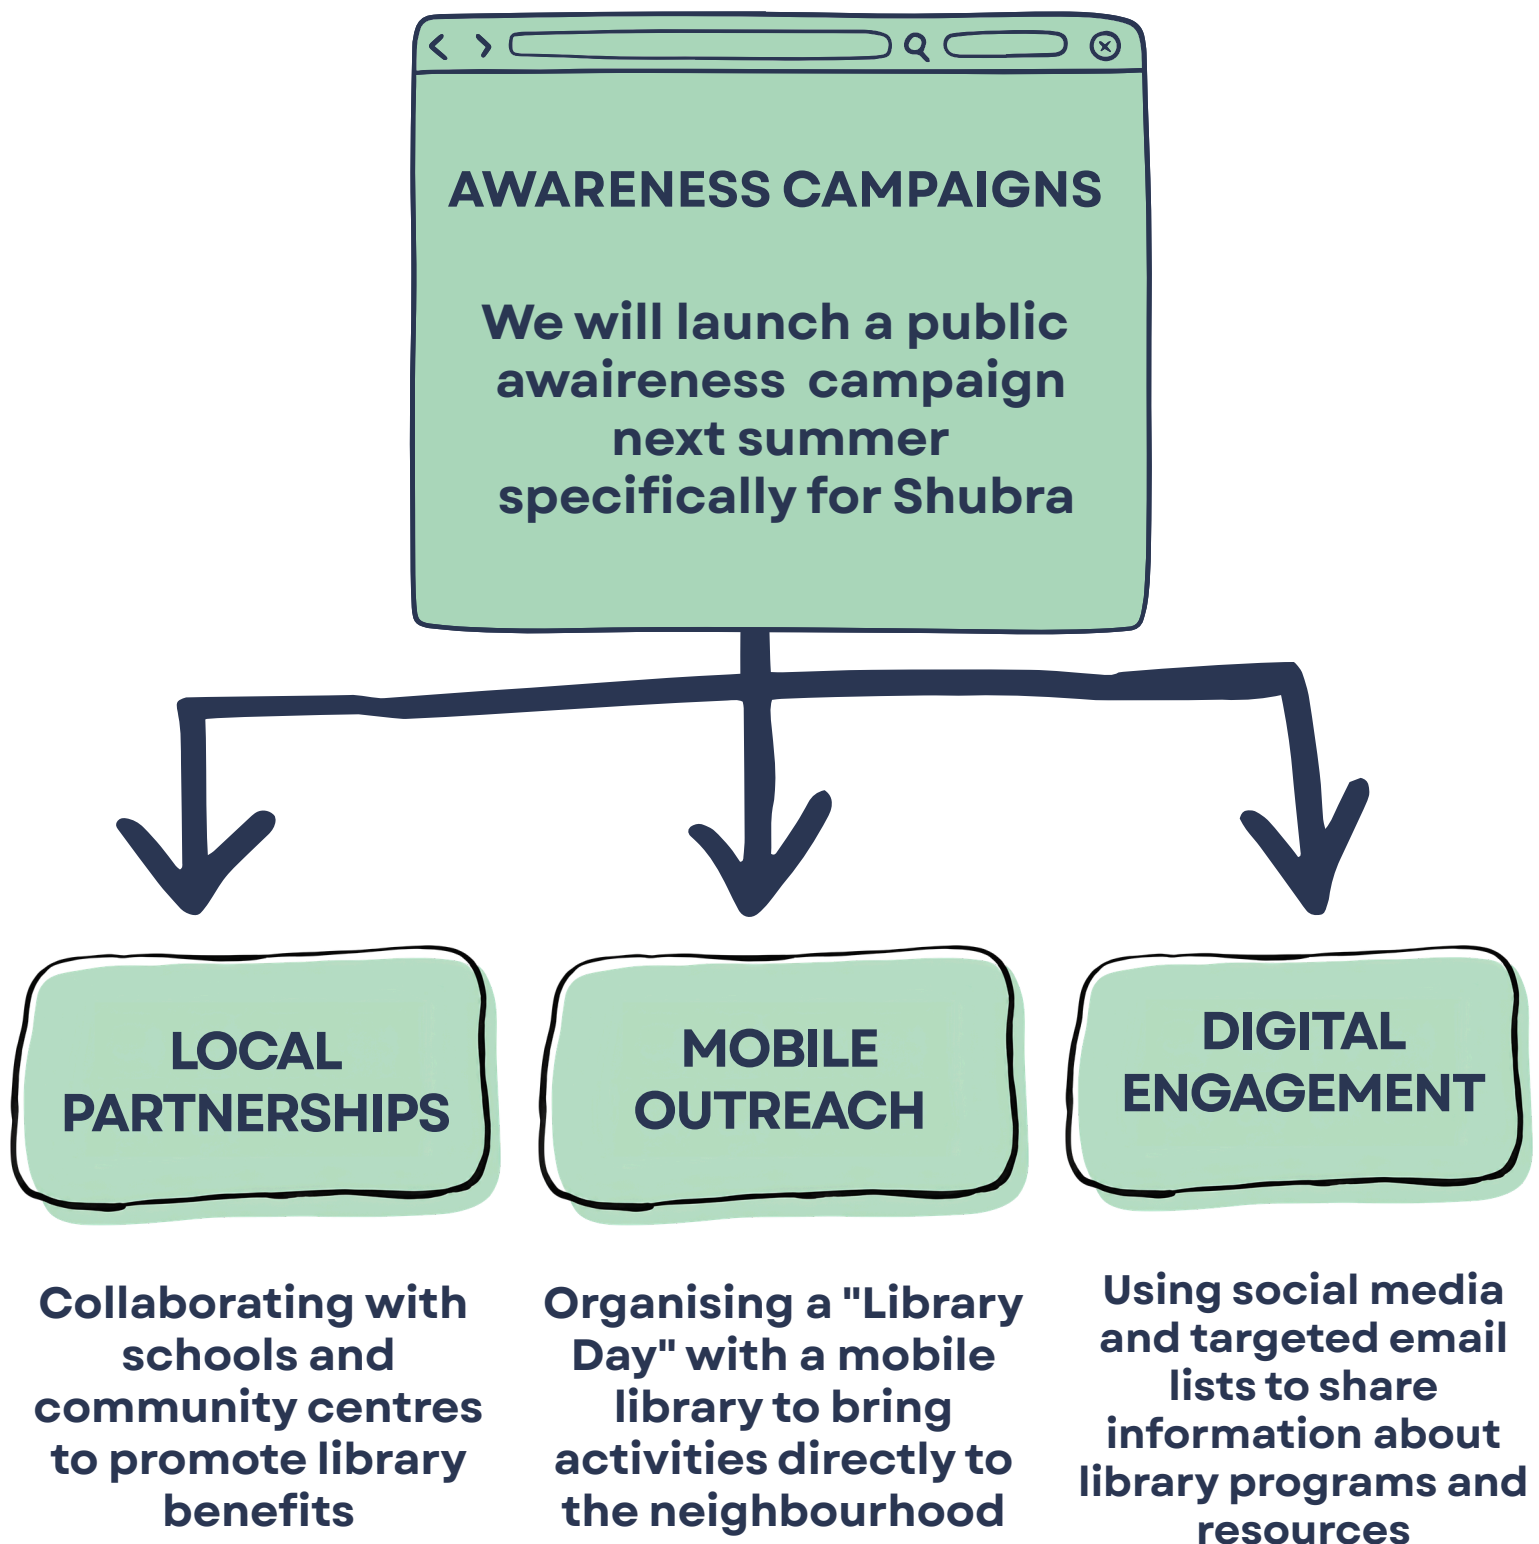

3. Plausible Reason

There are a few possible reasons for Shubra's low numbers. It may reflect lower awareness of the library's services within the Shubra community, or distance from the library may make visits less convenient for residents

4. Next Step

To improve these numbers, the library should launch a targeted outreach program and modernise its internal processes. This plan includes:

System Improvements

To better serve the community, we can enhance our library systems by:

DATA-INFORMED STRATEGIES

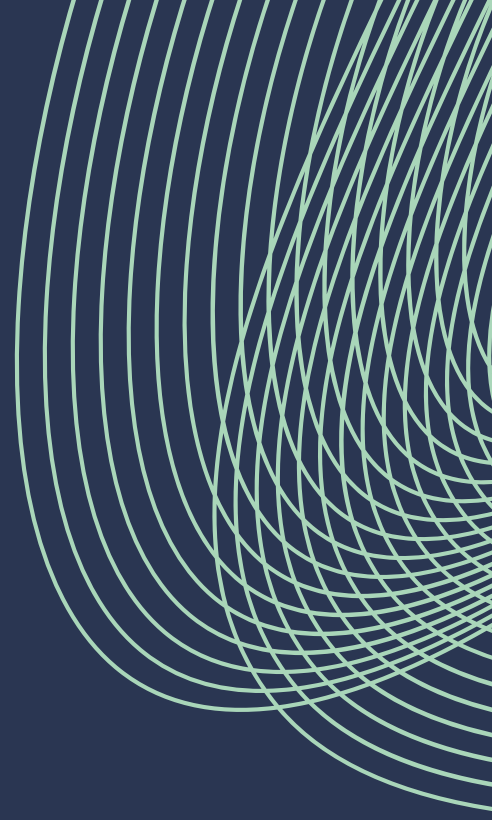

Using user data to segment audiences by location and interests, allowing us to send personalised invitations to residents in under-represented areas

INCREASING ACCESSIBILITY

Modernising our digital presence with virtual tours and 24/7 WiFi access to make the library a more visible community hub

STREAMLINING PROCESSES

Improving internal communication systems, such as using marketing checklists and shared schedules, to ensure all library staff can consistently promote our service

THANKS
